Density Altitude Written Assignment

NOTE: *Although this assignment is open-book, you may NOT receive or provide help from/to other students. By submitting, you agree that you completed this assignment without help from others. If you help other students or receive help from others you will receive a zero on this assignment and will not be invited to participate in other ADDA courses.*

*** Your answers will be different for this assignment, there is no hard and fast correct answer. What we are looking for is the correct process for determining air density altitude.**

**** The “6B: Density altitude calculation supplement” document is a very good resource to use for this assignment.**

1. For this assignment, calculate the density altitude at your current location using this web link for your nearest airport's data: <https://en.allmetsat.com/metar-taf/africa.php>
It is important that you show your work in this assignment, so be sure that any handwritten notes you may upload are legible, and that your thought process is clear in order to receive full marks.
 - a. In order to best evaluate your work, clearly list the following:
 - i. The airport that you've chosen to use
 - ii. The time at which you're recording its data
 - iii. The elevation of the airport
 - iv. The temperature
 - v. The pressure
 - b. Once you have successfully calculated your altitude density, briefly comment on the effect you think that it will have on an aircraft's flight.
